

Time & Turtle Soup

Presented by Timon

OVERVIEW

.....

The idea of turtle soup is **“Buy the Low and Sell the High”**

Price starts from Turtle Soup and Ends with Turtle Soup

Ict is the Key to the charts

Turtle Soup is the Key to ICT

.....

Pre-Knowledge

.....

Before knowing all about CRT we should know about
OHLC & OLHC , IPDA & Time Cycles.

Time Frame alignment:

Monthly- H4 PO3 , Weekly- H1 PO3 , Daily-M15 PO3 ,4 Hour-
M5 PO3

.....

x x x x

What is CRT?

.....

CRT- Candle Range Theory

Every candle is a Range.

All candles are Ranges

Ranges are Angels

.....

CANDLE FORMATION

OHLC / OLHC

Bullish

Bearish

OHLC / OLHC (3 Candle Theory)

1. Range (A)
2. Turtle Soup (M)
3. Expansion (D)

OHLC & OLHC (PO3/AMD)

2 Theories of Candle Deviation

Smart Money operates on specific quarters

1. A specific Monthly candle of the year.
2. A specific Weekly candle of the Month.
3. A specific Daily candle of the Week.
4. A specific Hourly candle of the Day.

TIME FRAME ALIGNMENT (HTF -LTF)

Monthly- H4 PO3

Weekly- H1 PO3

Daily- M15 PO3

4Hour- M5 PO3

HTF

LTF

Time & Turtle Soup

Chapter 1–Anatomy of HTF
Candle

Presented by Timon 

Over View

- Every Highs & Lows , Every Swing Points , Every MSS are Predetermined before the candle gets Printed.
- Remember Time is more important than Price so submit yourself to time.
- So in this thread we simply re-define **higher time frame** and their anatomy of Candle from (Monthly→ Daily TF),(Weekly→4 Hour),(Daily→1 Hour)

>>>>>

Monthly Candle

- In a month we have 2 high probability week.
- The Low/High of the Month mostly will form between 1st or 2nd Week.
- The High/Low of the Month mostly be capped on 3rd or 4th Week.
- By Differentiating we can simply play in expansion or distribution where price offers smooth entries on LTF.

>>>>>

Monthly Bullish Candle

x x x x

Monthly Bearish Candle

Weekly Candle

- There are 2 high probability trades per week.
- Once at Low and once at High of the week.
- The Low/High of the week mostly form between Monday-Wednesday.
- The High/Low of the week mostly be capped between Thursday-Friday

Weekly Bullish Candle

Weekly Bearish Candle

Daily Candle

- A Daily candle consists of Six 4hour Candles
- There are 2 high probability sessions per day totally 10 per week.
- Once every 1:00 AM candle or 9:00 AM candle
- To master a time-based model, choose one of the abovementioned and master it with precision while hitting from all angles.

x x x x

Daily Bullish Candle

>>>>>

Daily Bearish Candle

Conclusion

- Before knowing about Daily Bias , Before knowing Draw On Liquidity , Before Knowing about Execution we must know how to **Narrate** HTF before Diving into LTF.
- We simply dont trade patter with step by step approach by just learning the concept through a single thread.
- So we are slowing building our HTF Narrative with **logic** before diving deeper into the concept.

>>>>>

Hope this thread helped you to understand the Anatomy HTF Candle in the Vision of Candle Deviation.

Note: You dont need to implement all the HTF time frame into chart just get comfortable with One are Two HTF candle and master.

Time & Turtle Soup

Part 3-BIAS Building

Presented by Timon 

Elements to Build BIAS:

1. Order Flow a.k.a Market Structure
2. IPDA
3. IRL- > ERL , ERL- > IRL
4. Ranges
5. Determining DOL.

Presented by Timon

Market Structure

Market Structure is a Direction of Price Movement

There are three forms of Market Structure:

1. **Bullish M S**: Market makes Higher high and higher low

2. **Bearish M S**: Market makes Lower High and Lower Low

3. **Range/Sideway**: Market makes Higher Highs and Lower Lows inside a range bound market.

Presented by Timon

Order Flow

MARKET STRUCTURE IS HOW PRICE GETTING **FORMED** , ORDER FLOW IS HOW WE **READ** MARKET STRUCTURE IN FRACTAL WAY ALONG THE FORMATION.

Order flow is very important to determine BIAS , If you understand the order flow the BIAS gets easier.

- **Bullish:** In a Bullish OF price breaks the High with strong candle **closure higher** and lows gets **swept/rejected**. Bullish PD array gets **Respected** and bearish PD array gets **Inversed/Fails**.
- **Bearish:** In a Bearish OF price breaks the Low with strong candle **closure lower** and highs gets **swept/rejected**. Bearish PD array gets **Respected** and bullish PD arrays gets **Inversed/Fails**.

.

.

.

.

.

.

.

.

.

.

.

.

.

.

.

.

.

What are the Price Cycles Market do and don't?

Price starts from consolidation so the Next stage will always be an Expansion

Price can goes from

Expansion

Retracement

Reversal

Consolidation

Price cannot goes from

Consolidation

Retracement

Reversal

Presented by Timon

2.3

Reversal Model (AMD)

Consolidation >>> Expansion >>> Reversal >>> Retracement

Note: *Bearish Example

2.4

Continuation Model

Consolidation >>> *Expansion* ♻️ *Retracement*

Note: *Bearish Example

2.5

2.6

The algorithm reaches for 2 things:

1. Liquidity (Resting liquidity)
2. Imbalance (HTF Imbalance)

IPDA seeks liquidity and reprice to rebalance at the same time to ensure efficient delivery of price.

Algorithm is very efficient in delivering price, it rather hits two mangoes with one stone.

(IRL → ERL)  (ERL → IRL)

IRL – Internal Range Liquidity – Liquidity Inside a Dealing Range present in the Form of Imbalance

ERL – External Range Liquidity – Liquidity outside a dealing range present in the form of SSL/BSL.

➤ IRL-ERL=Imbalance  Liquidity=>Continuation

➤ ERL-IRL=Liquidity  Imbalance=>Counter trend

3.2

Price is always does two things:

- Offering fair value (**IRL**)  Seeking liquidity (**ERL**).
- This concept can be applied to ALL timeframes
- Combining ERL & IRL will give you a powerful tool for determining where price is likely to go
- Now you got the answer why & where does price moves from & to.

Time & Turtle Soup

Part 4- Ranges x Dol

Presented by Timon 

Diving Deep into Range

Chapter 1 : Anticipating Range Formation

Chapter 2 : CRT(Candle Range Theory)

Chapter 3 : Determining DOL

Presented by Timon

x x x

0.1

Over View

- Before diving deep all into Ranges lets have a short note on **turtle soup**.
- Turtle soup was vastly known as **False breakout** , a **raid** on stops above short term high/lows
- Turtle soup happens at the beginning of a candle which is the initial stage of Reversal after trapping Retailers at a **Key Level X Key time**.

Bullish Turtle Soup:

Presented by Timon

Anticipating Range Formation

- **What is a Range ?**
Generation of Liquidity in the form of accumulation where Highs and Low engenders Liquidity.
- **Why Range gets formed?**
Before making an expansion , price generates liquidity in the form of Ranges so its gets turtle souped.
- **Where does a Range gets formed?**
Ranges gets formed at the area of PD array or around Liquidity at a Key Time.

Presented by Timon

x x x

1.2

Every Candle has its own Range (Low - High / High - Low)

So the Range either gets manipulated or Broken Out.

Presented by Timon

x x x

How to Identify a Valid Range?

Even through every candle is a Range we dont see all of it.

Step 1 : Identify the order flow weather its
Bullish or bearish

Step 2 : Identify either Market Heading to
IRL-ERL or Diving to ERL-IRL

Step 3 : Mark out the recent beefy candle formed
near or at the HTF Array

Step 4 : Anticipate for turtle soup to happen at
a key time.

Step 1 :

Step 2 :

Step 3 :

Presented by Timon

1.8

Note on Range Candle :

- High Probability range candle forms after/near a Liquidity Pool or at a HTF PD array
 - Range candle is so crucial to simplify the Context and Narrative
 - They literally used to build liquidity at the Highs and Lows
 - So the Range candle gets confirmed by the next candle which manipulates either High/Low
-  Moreover the Price we need **time** in Action which confirms all the criteria above.

Presented by Timon

CRT (Candle Range Theory)

What is Candle Range Theory ?

- CRT is a Reversal Model which revolves around the Anatomy of 3 Candle Structure
- CRT combines the concept PO3 with Turtle Soup/HTF POI.
- CRT is much more than Price its the Time which confirms the Exact Reversal in price.

Where does CRT gets Formed?

- CRT must gets formed at the HTF Liquidity / HTF PD array especially When Both time and price meets.

Presented by Timon

x x x

Graphical Illustration

Every highs and lows are formed with this 3 candle structure which defines CRT

Presented by Timon

x x x

x x x

x x x

x x x

x x x

x x x

2.3

How to Identify a CRT ?

Step 1 : Identify and mark HTF Liquidity or HTF PD array.

Step 2 : Mark out the Range candle formed near/in the HTF POI & expect 2nd candle to manipulate either Range High/low.

Step 3 : If price was bullish anticipate range low to get Purge and revert vice versa for bearish.

Note: *2nd candle should have a healthy rejection from POI .
*2nd Candle should not body close the Range Candle.

Presented by Timon

2.4

Identifying Purge Candle: Bullish

Identifying Purge Candle: Bearish

Step 1:

Step 2:

Step 3:

Presented by Timon

Determining DOL

- Determining Draw on Liquidity (DOL) helps us to narrate market movements with the Directional Bias.
- DOL often act as Magnet for price , recognizing them will builds up bias which improves Narrative.
- Knowing the Draw on Liquidity helps to avoid unnecessary stop hunts and low probability setups.

Presented by Timon

x x x

3.2

Identifying DOL

- After identifying the Range candle , after identifying Purge candle its crucial to identify the Expansion Candle.
- So to identify where the Expansion leads we need to look out for the Draw On Liquidity.
- Draw On Liquidity always be at the Opposition side of manipulation Candle which purges High/low of the Range.
- In a bullish order flow after range low gets purged we simply target 50% level of Range as (LHF) and Range High as initial Draw On Liquidity(DOL).

Presented by Timon

x x x

3.5

Identifying Bullish CRT

Presented by Timon

Identifying Bearish CRT

Presented by Timon

Conclusion

Parts 2, 3, and 4 provided valuable insights through exploring the logic behind market movements.

They help to establish a directional bias which boosts your confidence by offering a clear and logical narration of the market's dynamics.

 Remember , none of this is random patterns —fuck those who trades useless, chaotic nonsense instead of following a logical, structured system.

Time & Turtle Soup

Part 5- CRT Subtypes

Presented by Timon

Over View

- Do you really think that CRT is always forms with the same three Candle Structure , if yes you are wrong.
- If you want answer for other variants for CRT just dive further into this thread to gain some insight of different Price formation.
- In this thread we gonna explore the different variants or other models of CRT.

Presented by Timon

x x x

Subtypes of CRT

Type 1 : 3 Candle CRT (Classic)

Type 2 : 2 Candle CRT (Aggressive)

Type 3 : Multiple Candle CRT (LP)

Type 4 : Inside Bar CRT (HP)

Type 5 : 3rd Candle Purge & Revert (Rare)

Presented by Timon

x x x

Type 1 : 3 Candle CRT

- 1) A **classic structure** which widely used by most of the trader using CRT.
- 2) 1st Candle forms a **Range** , 2nd Candle **Purges** Liquidity and 3rd candle **Reverts** to the opposite liquidity .
- 3) Everything settles within the 3 Candle.
- 4) We have a detailed notes on this model in previous threads.

Presented by Timon

Graphical Depiction : Bullish

Presented by Timon

Graphical Depiction : Bearish

Presented by Timon

2

Type 2 : 2 Candle CRT

- 1) The only difference from the previous model was Price expands and reaches DoI at the 2nd candle.
- 2) After 2nd candle purges liquidity from 1st candle price gets delivered **Aggressively** towards the Draw On liquidity within the 2nd Candle.
- 3) Two Candle CRT mostly occurs during a news or when price gets dilation before a Key Time.

TRADERS LAUNCH

Presented by Timon

x x x

2.2

Graphical Depiction : Bullish

Presented by Timon

2.3

Graphical Depiction : Bearish

Presented by Timon

x x x

Type 3 : Multiple Candle CRT

- 1) This model is so similar to the Classic CRT but the only difference is the 3rd Candle Expansion takes **multiple candle** to reach the overall Destination.
- 2) After 2nd candle purges liquidity from Range candle the Expansion **takes longer** than the range candle to distribute price towards the DOL.
- 3) This Model mostly occur at Counter trend / ERL (External) – IRL (Internal) or at PM session or on a **low probability condition**.

x x x

x x x

x x x

x x x

x x x

x x x

x x x

3.3 Graphical Depiction : Bearish

Presented by Timon

Type 4 : Inside Bar CRT

- 1) This model differs from all other variants , one of the most unique , high probability used by CRT traders.
- 2) After 1st candle forms a range then 2nd candle or upcoming candles forms **inside the 1st Candle Range** which makes Inside bar , when price purges High/Low of the Range then the Expansion towards the Opposition Liquidity said to be high probability.
- 3) Liquidity gets build in the form of inside Range candle so a false breakout happens at Engineered Liquidity.

Presented by Timon

x x x

4.2

Graphical Depiction : Bullish Inside Bar CRT

Presented by Timon

× ×

4.3

Graphical Depiction : Bearish Inside Bar CRT

Presented by Timon

× ×

Variant 5 : 3rd candle Reversal

- 1) This model forms in the same way as Classic CRT but the difference is after 2nd candle formation the 3rd candle Manipulates 2nd candle High/Low and Distributes to opposition liquidity.
- 2) Its a Rare case scenario can often seen in Lower Time Frame CRT where its a 3 drive pattern.
- 3) This model occurs during a High Impact News Events to trap early participants , on ERL (External) – IRL (Internal) or on Low Probability Condition.

Presented by Timon

x x x

5.2

Graphical Depiction : Bullish 3rd Candle Reversal

Presented by Timon

× ×

5.3

Graphical Depiction : Bearish 3rd Candle Reversal

Presented by Timon

× ×

Conclusion

I hope all the variants provide a valuable framework for understanding Candle Range Theory (CRT) and the different price movements associated with various models.

You don't need to master everything. Just choose one model, backtest it, forward test it, and focus on mastering it.
